Blando Brome		32
Rose Clover		25
Crimson Clover		15
Creeping Red Fescue		14
Zorro Fescue		5
Persian Clover		5
Wildflowers		4

Planting Instructions

Soil Preparation:

Clear the planting area of any weeds, debris, and existing vegetation.

Loosen the top 2-3" of soil using a rake or harrow. This helps the seeds make good contact with the soil.

Broadcasting:

Fill the broadcast spreader with the seed mix. Ensure the spreader is set to the appropriate setting for the seed size. (Slightly larger than tall fescue setting)

Walk at a consistent pace while evenly distributing the seeds across the prepared soil.

Soil Incorporation:

Lightly rake the soil to cover the seeds slightly. Aim to cover them with about 1/8-1/4" of soil. An even covering helps with germination and protects the seeds from birds and wind.

Optionally, use a roller or cultipacker to press the seeds firmly into the soil, ensuring good seed-to-soil contact.

Watering:

Monitor soil moisture, especially during the establishment phase. If rainfall is insufficient, supplement with additional watering.

After the plants establish, they typically require less frequent watering but should be monitored for signs of stress.

By following these steps, your Farmstead Showy Erosion Mix should establish a beautiful and functional cover that helps control erosion while providing aesthetic and ecological benefits. Happy planting!
